-!- PUNCTION: PRODUCED BY ACTIVED MACROPHAGES, IL-1 STIMULATES
-!- PUNCTION: PROLIFERATION BY INDUCING IL-2 RELEASE, B-CELL
THYMOCYTE PROLIFERATION, & FIBROBLAST GROWTH FACTOR ACTIVITY.
MATURATION & PROLIFERATION, & FIBROBLAST GROWTH FACTOR ACTIVITY.
IL-1 PROTEINS ARE INVOLVED IN THE INFLAMMATORY RESPONSE, BEING
IL-1 PROTEINS AS ENDOGENOUS PYROGENS, AND ARE REPORTED TO STIMULATE
THE RELEASE OF PROSTAGLANDIN AND COLLAGENASE FROM SYNOVIAL CELLS.
                "Comparative sequence analysis of cytokine genes from human and

FUNCTION: THIS IS A COPPER-CONTAINING OXIDASE THAT FUNCTIONS IN THE FORMATION OF PIGMENTS SUCH AS MELANINS AND OTHER POLYPHENOLIC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Dangy Y.-C., Ren S.-X., Li H.-L., Wang Y.-X., Fu G., Yang J., Qin Z.-Q., Mao Y.-G., Wang W.-Y., Chen R.-S., Shen Y., Chen Z., Yuan Z.-H., Zhao G.-P., Qu D., Danchin A., Wen Y.-M.;
"Genome-based analysis of virulence genes in a non-biofilm-forming Staphylococcus epidermidis strain (ATCC 12228).",
Mol. Microbiol. 49:15.77-1593(2003).
-!- CATALYTIC ACTIVITY: ATP + deamido-NAD(+) + NH(3) + H(2)O = AMP
-!- PATHWAY: NAD biosynthesis.
-!- SIMILARITY: Belongs to the NAD synthesis.
                                                                           CATALYTIC ACTIVITY: L-tyrosine + L-DOPA + O(2) = L-DOPA + DOPAQUINONE + H(2)O.
COFACTOR: Binds 2 copper ions per subunit (By similarity). SIMILARITY: Belongs to the tyrosinase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     0

Biochem kinses II of Saccharomyces cerevisiae contains two distinct regulatory submits, beta and beta.";

Arch. Biochem. Biophys. 309:348-355(1994).

-!- FUNCTION: Plays a complex role in regulating the basal catalytic activity of the alpha submit (By similarity).

-!- SUBUNIT: Tetramer composed of an alpha chain, an alpha', one beta chain and one beta chain.

-!- FTW: Phosphorylated by alpha chain (By similarity).

-!- SIMILARITY: Belongs to the casein kinase 2 beta chain family.

T. Complete genome sequence and analysis of Sephosphate phosphodiserter bonds at apurint are base-free deoxyribose 5-phosphate contained by the sequence of Sephosphodisentially attacks modified AP sites created by C. CATALYTIC ACTIVITY: Endonucleolytic cleavage to 5'-
T. COMPACTOR: Binds 3 zinc ions (By similarity).
T. SIMILARITY: Belongs to the AP endonuclease family 2.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  15-MAR-2004 (Rel. 43, Created)

"A genomic view of the human-Bacteroides thetaiotaomicron symbiosis.";
Science 299:2074-2076(2003).
-!- FUNCTION: Catalyzes the formation of N(7)-methylguanine at
position 46 (M7646) in tRNA (By similarity).
-!- CATALYTIC ACTIVITY: S-adenosyl-L-methionine + tRNA = S-adenosyl-L-
homocysteine + tRNA containing N(7)-methylguanine.
-!- SIMILARITY: Belongs to the methyltransferase superfamily. TrmB
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

-!-CATALYTIC ACTIVITY: S-adenosylmethioninamine + putrescine = 5'--
methylthicadenosine + spermidine.
-!- PATHWAY: Spermidine biosynthesis; fifth (last) step.
-!- SIMILARITY: Belongs to the spermidine/spermine synthase family.

MUCLectide sequence and expression analysis of the Acetobacter xylinum uridine diphosphoglucose pyrophosphorylase gene.";
J. Bacteriol. 173:7042-7045(1991).
-:- CATALYTIC ACTIVITY: The alpha-D-glucose 1-phosphate = diphosphate + UDF-glucose.
-:- SIMILARITY: Belongs to the prokaryotic UDFGP family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Science 287:1809-1815(2000).
-!- CATALYTIC ACTIVITY: dTTP + alpha-D-glucose 1-phosphate = diphosphate + dTDP-glucose.
-!- PATHWAY: RHAMNOSE BIOSYNTHESIS WITHIN THE O ANTIGEN BIOSYNTHESIS PATHWAY OF LIPOPOLYSACHARIDE BIOSYNTHESIS.
-!- SIMILARITY: Belongs to the glucose-1-phosphate thymidylyltransferase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              STRAIN=B1940 / Serogroup B, MEDLINE=94293762; PubMed=8022265; Mamerschmidt S., Birkholz C., Zahringer U., Robertson B.D., van Putten J.P.M., Ebeling O., Frosch M., "Contribution of genes from the capsule gene complex (cps) to liboligesaccharide blosynthesis and serum resistance in Neisseria

Natl. Acad. Sci. U.S.A. 99:14434-14439 (2002).
-!- CATALYTIC ACTIVITY: dTTP + alpha-D-glucose 1-phosphate diphosphate + furpP-glucose.
-!- PATHWAY: dTDP-L-rhamnose biosynthesis.
-!- PATHWAY: Belongs to the glucose-1-phosphate thymidylyltransferase family.

-!- POLYMORPHISM: There are two forms of NAT2: a rapid/stable isoform (Asn-99) and a slow/unstable isoform (Ile-99).
-!- SIMILARITY: Belongs to the arylamine N-acetyltransferase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Martell K.J., Levy G.N., Weber W.W.; "Cloned mouse N-acetyltransferases: enzymatic properties of expressed
                                                                                                                                              01-0CT-1996 (Rel. 34, Created)

"Antibiotic resistance as a stress response: complete sequencing of a large number of chromosomal loci in Staphylococcus aureus strain COL that impact on the expression of resistance to methicillin.";

Microb. Drug Resist. 5:163-175(1999).

-!- FUNCTION: Unusual circulary permuted GTPase that catalyzes rapid hydrolysis of GTP with a slow catalytic turnover (By similarity).

-!- SUBUNIT: Monomer (Probable).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Lancet 339:1819-1827(2002).
-!- FUNCTION: Unusual circulary permuted GTPase that catalyzes rapid hydrolysis of GTP with a slow catalytic turnover (By similarity).
-!- SUBUNIT: Monomer (Probable).
-!- SIMILARITY: Contains 1 engC GTPase domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     STEALN=MW2;

PATHWAY: DTDP-L-RHAMNOSE BIOSYNTHESIS WITHIN THE O ANTIGEN BIOSYNTHESIS PROBANTICEN SINGNAMERIS PATHWAY OF LIPOPOLYSACCHARIDE BIOSYNTHESIS.
SIMILARITY: Belongs to the glucose-1-phosphate thymidylyltransferase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Nature 413:852-856(2001).
-!- CATALYTIC ACTIVITY: dTTP + alpha-D-glucose 1-phosphate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Pfam, PF00483; NTP transferase, 1.

C Bacterium Clostridium acetobutylicum.";

J Bacterium Clostridium and oxidatively damaged proteins from irreversible aggregation. Plays an important role in the bacterial clost in the bacterial conditions conditions are formed converted conditions two disulfide bonds are formed converted conditions woo disulfide bonds are formed converted conditions with the protein is inactive (By similarity).

-!- PATHWAY: Coenzyme A (COA) biosynthesis; first step.
-!- SUBCELDULAR LOCATION: Cytoplasmic (Probable).
-!- SIMILARITY: Belongs to the prokaryotic pantothenate kinase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         SECUENCE FROM N.A.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Moltad A.K., Howland E., Sirevag R.;

Malate dehydrogenase from the thermophilic green bacterium chloroflexus aurantiacus: purification, molecular weight, amino acid composition, and partial amino acid sequence.";

J. Bacteriol. 170:2947-2953(1988).

-!-CATALYTIC ACTIVITY: (S)-malate + NAD(+) = oxaloacetate + NADH.

-!-SUBUNIT: HOMOTETRAMER (ACTIVE BNZYME); HOMODIMER AND HOMOTRIMER.

AT TEMPERATURES LOWER THAN 55 DEGREES CELSIUS (INACTIVE FORMS).

-!-SIMILARITY: Belongs to the LDH family. MDH subfamily.
STRAIN=J-10-f1;

PHY: Phosphorylated in vitro on serine(s) and threonine(s) by PKC. SIMILARITY: Belongs to the annexin family.

SIMILARITY: Contains 4 annexin repeats.

--- SUBUNIT: Homodimer. The RNAP catalytic core consists of 2 alpha, beta, 1 beta' and 1 omega subunit (By similarity).

--- DOMAIN: The N-terminal domain is essential for RNAP assembly and basal transcription, whereas the C-terminal domain is involved in interaction with transcriptional regulators and with upstream promoter elements (By similarity).

--- SIMILARITY: Belongs to the RNA polymerase alpha chain family.
                                                                                                                                                                                                                                                                                                                                                          30-MAY-2000 (Rel. 39, Last sequence update)
28-FBB-2003 (Rel. 41, Last annotation update)
DNA-directed RNA polymerase alpha chain (BC 2.7.7.6) (RNAP alpha subunit) (Transcriptase alpha chain) (RNA polymerase alpha subunit).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Deckert G., Warren P.V., Gaasterland T., Young W.G., Lenox A.L., Graham D.E., Overbeek R., Snead M.A., Keller M., Aujay M., Huber R., Feldman R.A., Short J.M., Olson G.J., Swanson R.V., "The complete genome of the hyperthermophilic bacterium Aquifex

                                                                                                                                             PTM: N- and O-glycosylated.

MISCELLANEOUS: There are two kinds of Fc receptors for 1gE, which differ in both structure and function: high affinity receptors on basophils and mast cells and low affinity receptors on lymphocytes
"Structure-based modeling of the ligand binding domain of the human cell surface receptor CD23 and comparison of two independently derived molecular models.";

Protein Sci. 5:240-247(1996).

-!- FUNCTION: This receptor has essential roles in the regulation of IgE production and in the differentiation of B-cells (it is a B-cell-specific antigen).

-!- SUBCELMULAR LOCATION: TYPE II MEMBRANE PROTEIN. ALSO EXISTS AS A SOLUBLE EXCRETED FORM.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             SOLUBLE FORM.

-!- CATALYTIC ACTIVITY: 2'-deoxyribonucleoside diphosphate + oxidized
thioredoxin + H(2)O = ribonucleoside diphosphate + reduced
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

    -!- PATHWAY: DNA replication pathway; first step.
    -!- SUBUNIT: Heterodimer of a large and a small chain.
    -!- SIMILARITY: Belongs to the ribonucleoside diphosphate reductase

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     HSSP, P29095, LAIS.

Transcription regulation; Repeat; Zinc-finger; Metal-binding; Zinc;
FUNCTION: Stabilizes TBP binding to an archaeal box-A promoter. Also responsible for recruiting RNA polymerase II to the preinitiation complex (DNA-TBP-FIIB) (By similarity).

COFACTOR: Binds 1 zinc ion per subunit (By similarity).

SIMILARITY: Belongs to the TFIIB family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            SEQUENCE FROM N.A.
